Preface:

Heat transfer presses are the perfect solution for small businesses and craft persons involved in heat transfer of ink jet and other transfer papers.

Applied material: Clothing, Metal scutcheon, Ceramic tile etc

①: Pressure Knot  
②: Off/on Switch  
③: connect power cord  
④: Protecting clothing  
⑤: UP Heat platen  
⑥: Clamp&handle  
⑦: Rocking Handle  
⑧: Control console

First of all, we should distinguish the material of the Clothing; for different clothing, we have different printing methods. There are two kind of methods: (1) For 75%-100% cotton T-shirt, you can use sublimation ink printing onto T-shirt transfer paper; Temperature: 180℃ Time: 15-30S.  
(2) Another way is to use Pigment ink (or Sublimation ink) printing onto Inkjet transfer paper, In this way, you can transfer images onto silk, fiber, terylene etc material , temperature: 180℃ Time: 80-120S.
Procedures

1. Preparation

Use pigment ink or sublimation ink to print the pictures out.
Cut out the picture for transferring
Prepare the T-shirt for transferring

Adjust the pressure by pressure knob
Pick up the handle, and swing away the up platen aside
Flattening the T-shirt on the Silica Gel Board

2. Setting of the Control panel

Turn on the power switch
Temperature light-ON
Select with arrows temperature required,
(Normally 180°C)
Left arrow select Up.
Right arrow select Down
Press OK button after temperature set
now timer light-ON

Select with arrows time required,
( Note: 20-30 seconds for 75%-100% cotton T-shirt
120 seconds for the material as silk, fiber, etc. )

Press OK button again,
The program will stay in memory of
the control board and
the temperature starts to rise

3. Transferring

Once the temperature rise to the required
180°C the buzzer will send out a short sound

Place the transfer ink side down onto T-shirts

Pull back the up platen to original position

Close the handle of the press
and press OK button

Now time is counting down

When the time reaches to the set point,
the buzzer sing again. Open the press.
When the time reaches to the set point, the buzzer sing again. Open the press. Tear paper backing slightly. (Note: if it is heat transfer paper, pls do that as soon as possible, and if it is cool transfer paper, pls brushing the transfer paper by scrubbing brush, after 5-10 seconds, then take out the paper.) Beautiful pictures have been transferring to the T-shirt.

**Technical Specification**

- **Voltage:** 110V/220V
- **Power:** 1800W
- **Current:** 15A
- **Temperature Range:** 0-250 °C
- **Time Range:** 0-3 Minutes
- **Worktable Size:** 15 Inch *15 Inch
- **Box Size:** 73CM*50CM*45CM
- **Gross Weight:** 38kg

**Trouble shooting for transfer quality:**

A. If the color is pale: the temperature is too low / the pressure is not correct / or not pressed long enough.
B. If the picture is blurring: Too much transfer time causes proliferation.
C. If a part of picture is blurring: Heat was not distributed correctly through heat plate. Allow more time between press operations. Pressure distribution can also be the cause, which can be set on the four plate surface adjusters. Please note that it has been factory set and there should be no need to adjust them.
D. If the pattern is scarred: Transfer time is too long.
E. The pattern of color is different: the pressure is not correct or the transfer paper is poor quality
F. Adhesive paper: the temperature is too high or poor printing ink.
**Circuit Diagram**

![Circuit Diagram](image)

- a: PCB
- b: Switch
- c: Fuse
- d: Aerial Plug
- e: Relay

**PCB Definition:**

1, 2 Electrical source tie-in;
3, 4 Radiation pipe tie-in;
5, 6 Sensor tie-in;
7, 8 Relay output tie-in;
9, 10 Relay input tie-in

**Maintenance:**

**I. No action after switch on the power**

1. Check the plug whether it touches well
2. Check the fuse whether it have been burn out.
3. Check the lead wire of the switch whether it have been fallen

**II. The display screen are working well, but the no temperature increasing on the Silica Gel Board**

1. Check whether the tie-in of the Silica Gel touches well
2. Check the 3,4 on PCB in the back box whether it touches well

**III. The display screen is un-normal, but the Silica Gel heats.**

Maybe for the fault of the PCB
IV. The display screen and Silica Gel works well, but un-normal show of the temperature.
   1. Check whether the tie-in of the Silica Gel touches well.
   2. Check the 5, 6 on PCB in the back box whether it touches well.

Advise: 1. Because the material and the thickness of the clothing are different, the temperature and the time are different too.
        2. The temperature and the time are only for reference. And pls first try a sample to adjust the best temperature and time.
        3. The best setting temperature are 180°C, pls do not over 220°C, and the transferring time should be within 3 minutes.
        4. To make sure that the circuit can bear high-power machine, or it will bring about faulty of the fuse etc.
